

Covers and metal sheets

TRANSPORT AND STORAGE INSTRUCTIONS

Galvanised covers must be transported and stored in a dry place.

Transport and storage must be carried out in such a way that no moisture can penetrate between the galvanised covers stored in the stack, either directly due to water or condensation.

Covers that have become wet in the stack must be set up individually immediately and allowed to dry.

(Permanent exposure to moisture - e.g. condensation - causes staining and possibly damage to the material (white rust/red rust).

Protect galvanised covers from contact with artificial fertilisers, salts, alkalis and acids.

On building sites, store the material on dry and covered supports. Ensure that the galvanised surface remains undamaged even after installation and is not exposed to aggressive influences!
